

Diagnostic Review: UrbanStyle Data Architecture

Week 1 Executive Summary:
Sales, Customers, and
Products Profile

SYSTEM AUDIT: COMPLETE

Executive Overview: Database Health

Sales Data

15,234 Rows

Warning: Anomalies Detected

Customer Data

3,150 Rows

Critical: Interventions Required

Product Data

362 Rows

Clean: Flawless Integrity

While Product catalogs are pristine, Sales and Customer tables reveal structural fractures requiring immediate executive triage.

Sales Domain: Scope and Schema

Total Rows:
15,234

Behavioral & Financial Telemetry: Sales Insights

Insight: The Shopping Cart Effect

Only 10,118 unique `sale_id` values exist across 15,234 rows.

Diagnostic: Customers are placing multi-line orders. The highest value transactions are driven by premium inventory, specifically "Öhuline sporditossud" at €434.08.

Warning: Financial Discrepancy

Queries reveal negative `total_price` values co-existing with positive `unit_price` values.

Diagnostic: This mathematical contradiction indicates unflagged returns, system adjustments, or corrupted financial data requiring immediate investigation.

Critical Void: The Anonymous Guest Checkout

Data Issue: Exactly 1,487 transaction rows contain a NULL value for `customer_id`.

Marketing Impact (Attn: Anna Mets)

These represent anonymous guest checkouts. This 9.76% blind spot prevents marketing from retargeting nearly 1 in 10 purchasers, presenting a hard cap on campaign reach.

Customer Domain: Registration and Geography

Total Volume

3,150 registered customers.
First names are 100% complete.

Registration Span

5 years of acquisition.
Earliest record: Jan 2, 2020.
Most recent: Feb 27, 2025.

Geographic Reality

UrbanStyle customers are
distributed across exactly 12
real-world cities.

Data Fracture: The City Inflation Effect

The Database returns 54 distinct city variants.

Diagnostic: Inconsistent capitalization severely inflates geographic counts. The city of Tallinn alone is split across 5 different text variants, scattering 1,238 customers who should be consolidated into a single regional report.

Identity Conflicts: Missing Emails and Cloned Profiles

Missing Contact Data

380 customers (12%) have a completely blank email field.

Duplication Reality

Only 2,640 unique addresses exist for 2,770 rows. Exactly 130 customers share an email.

Spot-Check Audit:

Manual system audits confirm these are cloned records, not household sharing. Profiles like 'KEVIN Arro' and 'Kevin Arro' appear as multiple distinct IDs with identical contact details.

Product Domain: 100% Clean Data Integrity

Total Products: 362

Data Columns: 9

Missing Data: Zero

product_id, product_name,

aksessuaarid (67)

Market Positioning: The Category Price Spectrum

Blind Spots: Pending Phase 2 Extractions

Diagnostic Note: The database schema confirms the existence of these critical transactional columns. However, the current Week 1 Executive data pull did not extract the distinct values or null-counts for these specific fields.

Status Report: Assessing omni-channel performance and payment behavior is flagged as the immediate priority for Phase 2 data extraction.

Synthesis: Strategic Roadblocks & Next Steps

Marketing Impact

Data Reality: 9.7% anonymous sales + 12% missing emails + duplicated customer profiles.

Consequence: Severe limitations on targeted outreach, artificial inflation of acquisition metrics, and skewed loyalty tracking.

Reporting Impact

Data Reality: Negative transaction prices + 54 fractured city strings for 12 locations.

Consequence: Both financial reporting and regional performance dashboards remain unreliable until a strict data-cleaning protocol is enforced.

SYSTEM READOUT: Database architecture holds deep, actionable insights (premium footwear dominance, multi-line cart behavior), but requires immediate sanitization prior to strategic deployment.
