

Team Urban Style Sales Data Audit

STATUS: ACTION REQUIRED

The raw sales dataset contains highly useful transaction-level data. However, critical structural anomalies have been identified. Targeted clarification is required before this data can be fully trusted for executive financial reporting.

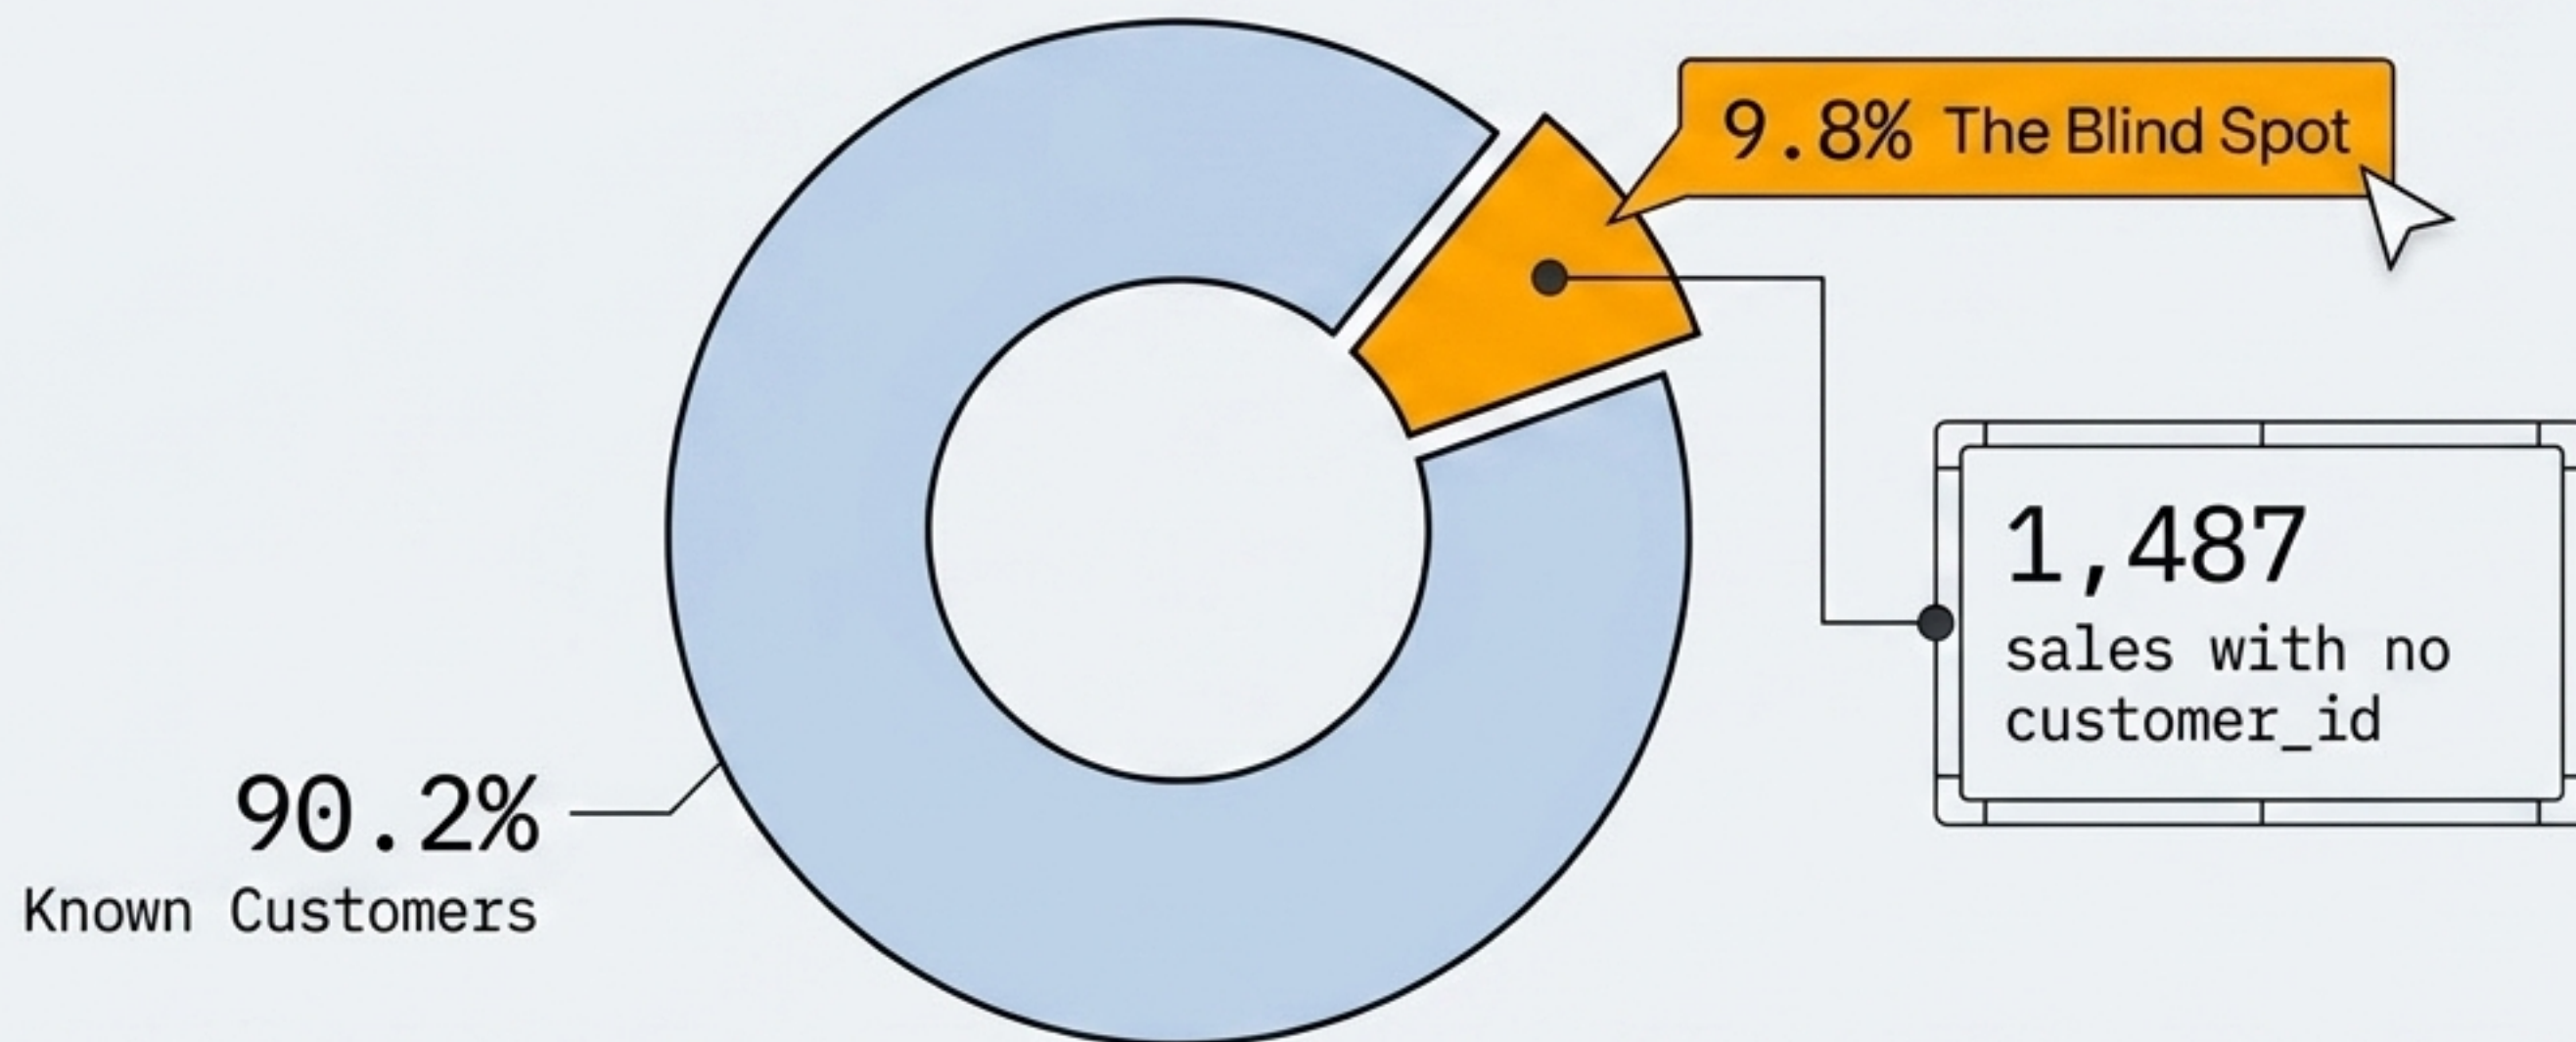

The dataset provides a substantial foundation of transaction records

This structure provides a comprehensive, multi-dimensional view of sales-if data integrity is maintained.

Nearly one in ten transactions cannot be tied to a buyer

Transactions missing a customer_id cannot be tracked to individual buyer behaviors, heavily skewing customer lifetime value (CLV) and segmentation reporting.

System logic generates negative totals from positive unit prices

[Unit Price (+)] × [Quantity (?)] = [Total Price (-)]

The Anomaly	The Hypothesis
The system records negative total_price values despite positive unit_price inputs.	This mathematical paradox likely indicates returns, voided items, or system adjustments being logged with negative quantities.

If left unclarified, these unflagged negative totals will severely distort gross revenue roll-ups.

Two structural anomalies threaten reporting accuracy

Anomaly Type	Scale	Visual Evidence	Potential Root Cause	Reporting Impact
Missing Customer Data	9.8% (1,487 rows)	Blank customer_id fields	Unregistered guests or checkout system glitch	Skews customer-centric metrics (CLV, retention)
Negative Total Pricing	Variable	(+) unit = (-) total	Returns, adjustments, or logic errors	Corrupts gross revenue and profitability roll-ups

Detailed reporting must pause until anomalies are resolved

Current State: Raw Data
Anomalies Present

Proceed immediately to detailed executive reporting.

High risk of inaccurate financial models

Initiate Resolution Protocol.

Action Checklist

1. Investigate the system logic causing negative transaction values.
2. Trace the origin of the 1,487 missing customer IDs.
3. Cleanse and verify dataset logic prior to final reporting approval.
